Cisco® Software Defined Access and ISE Integration for Policy Deployment and Enforcement (SDAISE) / 3395 / Days: 3

There are many challenges today in managing the network because of manual configuration and fragmented tool offerings. Manual operations are slow and error-prone and these issues will be exacerbated due to the constantly changing environment with more users, devices and applications. With the growth of users and different devices types coming into the network, it is more complex to configure user credentials and maintain a consistent policy across the network. If your policy is not consistent, there is the added complexity of maintaining separate policies between wired and wireless. As users move around the network, it also becomes difficult to locate users and troubleshoot issues. The bottom line is that the networks of today do not address today's network needs. This SDA course addresses these issues. Software-Defined Access (SD-Access) is the industry's first intent-based networking solution for the Enterprise built on the principles of Cisco's Digital Network Architecture (DNA). SD-Access provides automated end-to-end segmentation to separate user, device and application traffic without redesigning the network. SD-Access automates user access policy so organizations can make sure the right policies are established for any user or device with any application across the network. This is accomplished with a single network fabric across LAN and WLAN which creates a consistent user experience anywhere without compromising on security.

Mastering Angular (TT4168) / 2595 / Days: 5

Angular is one of the most popular JavaScript frameworks for creating web and native mobile applications by implementing several features and capabilities:

Single Page Applications (SPAs) load a single HTML page that is dynamically updated based on user interaction. SPAs can communicate with the server-side to load data into the application without a full-page refresh.

Two-way data binding means that when the data store updates, the UI is immediately updated (and vice versa).

Modules divide code into reusable parts with related components, directives, pipes, and services grouped together and can be combined with each other to create an application.

Angular uses a dependency injection design pattern for services, increasing code efficiency and modularity. Thanks to Angular's Model-View-* architecture, enforcing the Single Responsibility Principle (SRP) and Don't Repeat Yourself (DRY) techniques, coding is reduced into the smallest pieces possible.

The declarative user interface means the presentational logic in HTML is separated from the imperative logic and Angular's data binding. Angular is also easily integrated into other frameworks, such as Ionic.

Mastering Angular is a five-day, hands-on course that thoroughly explores the latest Angular features and advances, demonstrating how to solve the traditional challenges of JavaScript web application development.

Throughout the course students will build custom components using application routes, form validation, and unit-testing. The course starts with an introduction of Angular CLI and TypeScript, and then delves into component-driven development with Angular components, covering data-binding, directives, services, routing, HTTP, the RxJS library, forms unit testing, and REST. Students will also learn how to add authentication, use the Material library, learn the NgRX design pattern to implement the NgRX store, make custom directives, enhance their application with animations, write an E2E test, and increase their application's efficiency by lazy loading modules and creating their own Angular library.

Mastering React | React Foundation (TT4195) / 2695 / Days: 5

Mastering React is a comprehensive hands-on course that aims to be the single most useful resource on getting up to speed quickly with React. Geared for more experienced web developers new to React, this course provides students with the core knowledge and hands-on skills they require to build reliable, powerful React apps. After the first few modules, you'll have a solid understanding of React's fundamentals and will be able to build a wide array of rich, interactive web apps with the framework. The first module is an introduction to the new functionality in ECMAScript 6 (JavaScript). Client-side routing between pages, managing complex state, and heavy API interaction at scale are also covered.

This course consists of two parts. In the first part of the course students will explore all the fundamentals with a progressive, example-driven approach. You'll create your first apps, learn how to write components, start handling user interaction, and manage rich forms. We end the first part by exploring the inner workings of Create React App (Facebook's tool for running React apps), writing automated unit tests, and building a multi-page app that uses client-side routing.

The latter part of the course moves into more advanced concepts that you'll see used in large, production applications. These concepts explore strategies for data architecture, transport, and management:

Redux is a state management paradigm based on the Flux architecture. Redux provides a structure for large state trees and allows you to decouple user interaction in your app from state changes.

GraphQL is a powerful, typed, REST API alternative where the client describes the data it needs.

Hooks is the powerful, new way to maintain state and properties with functional components and the future of React according to Facebook.
